

FOR IMMEDIATE RELEASE

ACTIA Makes Pattern Recognition Technology Available To Heavy-Duty Vehicle Manufacturers

Dearborn, Michigan - ACTIA's Pattern Recognition technology works by creating a reference database for normal and common failures. It analyzes real-time vehicle data and can detect performance degradation, often, before system/component failure.

Pattern Recognition is especially valuable to provide prognostics for a variety of systems not monitored directly by the ECU, i.e., air intake, fuel system, and some EGR systems.

Pattern Recognition can be embedded as an on-board solution by the manufacturer or integrated into a service tool to provide prognostics capabilities.

ACTIA is a global supplier to the commercial vehicle and automotive markets with products and engineering services focused on vehicle communication interfaces, shop equipment and vehicle diagnostics. ACTIA has extensive experience in the integration of vehicle electronics and service technologies. Our ability to understand the whole vehicle ensures that our solutions are practical, efficient, and cost effective, while at the same time maximizing vehicle serviceability. As a partner of the major OEMs worldwide, ACTIA provides an extensive expertise in product design and validation, software development, manufacturing, final product assembly and tests.

Thinking Globally....Acting Locally!
